Light Scattering Reviews 3 | SpringerLink

This review covers the progress of light scattering applications in the field of particle characterization in the past decade. The review addresses static light scattering (the measurement of scattering intensities due to light-particle interaction at various spatial locations), dynamic light scattering (the measurement of scattering due to light-particle interaction as a function of time ...

Light Scattering Reviews 9: Light Scattering and Radiative

Scattering is a general physical process where some forms of radiation, such as light, sound, or moving particles, are forced to deviate from a straight trajectory by one or more paths due to localized non-uniformities in the medium through which they pass. In conventional use, this also includes deviation of reflected radiation from the angle predicted by the law of reflection.

Dynamic light scattering as a relative tool for assessing

In summary, light scattering experiments can be used to measure three things: weight average molecular weight (M_w), mean-squared radius of gyration ($\langle r_g^2 \rangle$), and the second virial coefficient (A_2 or \hat{A}_2). To interpret light scattering experiments, we begin with a discussion of light scattering theories.
